

# Report of Working Group 3.2 SIM Infrastructure

Keith MURRAY

#### Political Issues

- Keith Murray inherited Comm 3.2 immediately prior to the Washington Congress
- There was no established work plan at that time and an attempt was made to identify common issues in Washington
- This proved impossible and the following slides record subsequent events.
- At the end a challenge to FIG regarding how it deals with SIM in the future is presented – I am happy to discuss this later in the week
- The period 2004-2006 was also a period where I was President of EuroSDR which demanded a lot of time owing the transition of the organisation from International Treaty to Not for Profit Company.

### Officers and Members

- Chair: Keith Murray
- Co-Chair: Martin Scheu
- WG-members
  - Members recruited at the Washington Congress agreed to participate but following the Congress all contact was lost despite several attempts at contact
  - Carsten Rönsdorf was recruited to supported the WG from 2004 onwards

# Specific Projects and Activities

- Original plans were not fulfilled due to lack of support
- Modified Plans were presented but even these had to be scaled back due to lack of willing supporters
- Plans were then refocused in late 2003 which led to collaborative initiatives with EuroSDR on data quality issues.
- This led to two very successful workshops regarding data quality see over.

### Outputs: Workshops on PAI

- Positional Accuracy Improvement Workshop [PAI]
  - Workshop held in Malahide, near Dublin, Ireland in 2004
- Positional Accuracy Improvement Workshop II ۲
  - Workshop held at LVG, Munich, Germany in 2005
- As the workshops were developed in conjunction with EuroSDR, the material from the PAI workshops has also fed into the spring 2005 and spring 2006 EuroSDR e-learning courses on PAI
- These two workshops have also led to a "Quality" ٠ Management for Geodata" workshop to be held at this Congress (see WS 1 led by Scheu and Rönsdorf @ 10.30 on 9 October in Room 21a).
- Murray also wrote several papers e.g. "What is an SDI?" which were under a FIG banner.

# Conclusion

- A lot is happening in the sphere of SIM currently e.g. INSPIRE in Europe
- FIG is *generally not recognised as a key player* in this world owing to the perception that it is mainly about surveying (focussing on how countries were mapped or measurements made) This was a strong perception after the Cairo meeting from people attending from the GSDI perspective
- As with all such organisations one has to stand back regularly and review what the "value-add" is that, in this case, what does FIG bring to the GI community?, what does it do that is unique? and is not done by others?
- With such clarity it may be possible then to stage events in the field of SIM that complement and draw attendees to events that are not available elsewhere
- Alternatively if this is not possible, collaborative alliances should be targeted and formed to share organisation, topics and potential delegate lists. (This was successful with EuroSDR in this case).
- I would like to thank Martin Scheu and Carsten Rönsdorf for their major contributions to Comm 3.2 over the past two years.

And good luck to all of you going forward for 2006-2010!
