TS 32 – SDI - Developments

Monitoring of Spatial Data Infrastructures (SDI)

Dr.-Ing. Martin Scheu
Dr.-Ing. Andreas Rose
grit GmbH

- The Open Geospatial Consortium, Inc (OGC) is an international industry consortium of 314 companies, government agencies and universities.
- OpenGIS® Specifications support interoperable solutions that "geo-enable" the Web, wireless and location-based services, and mainstream IT.
 - *GetCapabilities* >> XML-Data
 - *GetMap* >> Raster (PNG/JPEG)
 - *GetFeatureInfo*>> Dokument (XML, HTML)

Navigation dataset 1:25.000

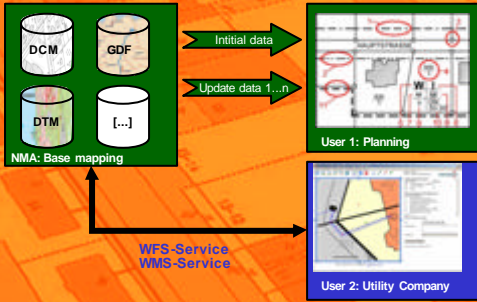

Source: LGB Brandenburg, 2006

• Spatial data sources:

- ① WMS: Base map 1:1.000
- ② Asset data

① building assigned to base data

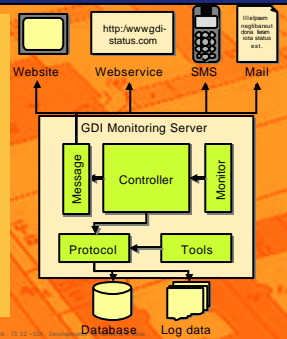

② Cable assigned to asset data

- It is a big step from a Web Map Service towards a Spatial Data Infrastructure (SDI)
- It has to work everywhere and at any time.
- No one will rely on infrastructures which work at one moment and is out of function at another.
- In many cases service breakdowns are reported by the customers, surely the worst method to monitor an infrastructure.

- Put up an automat (monitor) which constantly watches a Web Map Server and alerts the system administrator in case of any malfunction.
- It should...
 - work continuously and in the background,
 - notify problems immediately,
 - provide extended log files,
 - and help to minimize failure down times.

- Push-procedure
 - Mail
 - SMS
 - Language (optional)
- Pull procedure
 - Log data
 - Website
 - Status service

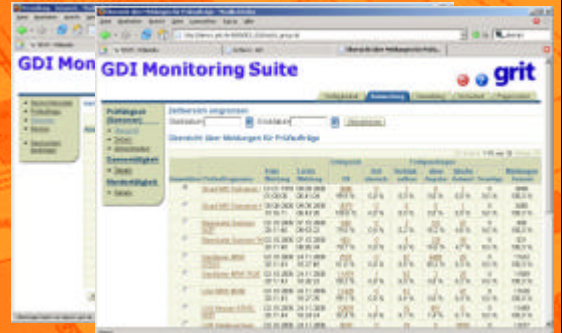

- ... permanent verification of the system
- ... active notification of malfunctions

- Each sensor has a specific task, is dedicated to a specific system functionality.
- System availability
 - Control of guaranteed features, e.g. 24x7 (SLA)
 - Logs of downtimes

- System security
 - Simulation of hack-attacks
 - Access (forgery, abuse)
 - Secure communication
 - Tests of backup mechanisms
 - Regularity
 - Completeness
 - Logs of failed attacks
 - Login attempts

- Digital spatial information can be used everywhere but is far from being ubiquitous.
- The basic property of an infrastructure – reliability – has to be assured and its monitoring is one important task.
- Without sustainable monitoring Spatial Services are subject to undetected failures and will not be accepted in business workflows of public and industrial customers.
