

National Geodetic Survey

FIG Working Week 2008 Stockholm, Sweden June 14-19, 2008

The Surveyor: Charting the World's Course- What's in the Future?

David Zilkoski, Director
National Geodetic Survey
National Ocean Service
National Oceanic and Atmospheric Administration
United States Department of Commerce

National Oceanic and Atmospheric Administration

National Geodetic Survey

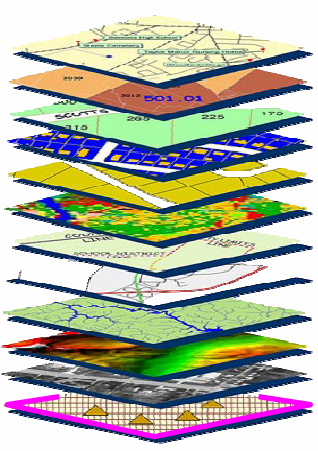

Surveyors Provide the Foundation for all Geospatial Positioning Products and Services

Geodetic control is the foundation required for all geospatial products.

National surveying agencies provide their users with a consistent national coordinate system, which includes:

- Latitude
- Longitude
- Height
- Scale
- Gravity
- Orientation

Geodetic Control is the **Critical Layer** for GIS Applications

and how these values change with time.

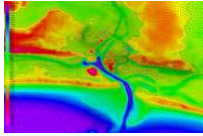

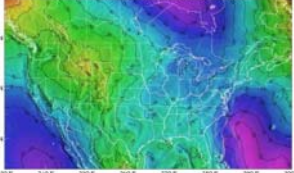

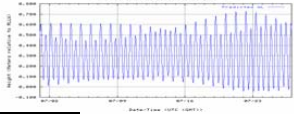

National Oceanic and Atmospheric Administration

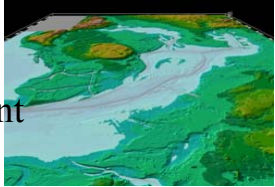

National Geodetic Survey

What do you need to develop geospatial products and services?

- Water level data
- Geodetic Data
- Geophysical data
- Models
- Transformation programs
- GIS applications
- Subsidence/Crustal Movement

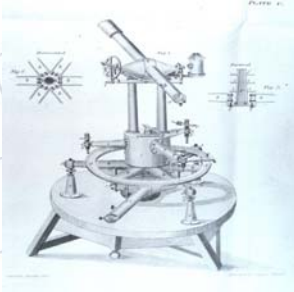

National Oceanic and Atmospheric Administration

National Geodetic Survey

Past Tools - Angle Measurement

**Troughton 24"
theodolite**

**Parkhurst
Theodolite**

**Wild T-3
Theodolite**

National Oceanic and Atmospheric Administration

Past Tools - Distance Measurement

Taping a base line

EDMI

Measuring a base line w/ a bar

Past Tools - SPIRIT LEVELING

Leveling party using spirit leveling techniques.

Automatic Level

This is the high accuracy electronic level. It scans a special barcode rod to determine an exact height.

National Geodetic Survey

Surveyors Have Three Basic Capabilities that they provide to Geospatial Users

Geospatial Infrastructure

Models & Tools

Outside Capacity

National Oceanic and Atmospheric Administration

National Geodetic Survey

What I See: Percent of Resources Allocated to These Capabilities

Infrastructure - 80%

Models & Tools - 15%

Outside Capacity - 5%

OPUS solution

Your data must be dual frequency data (L1 and L2) and a minimum of 2 hours of observations is recommended.
Your collection rate must be 1,2,3,5,10,15 or 30 seconds.

CSRS-PPP

CSRS-PPP is an on-line application for GPS data post-processing that allows GPS users to submit observation data over the Internet and recover, using

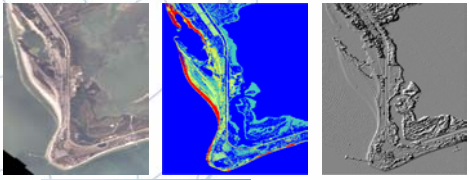

National Oceanic and Atmospheric Administration

National Geodetic Survey

Resulting In:

Simple, user-friendly, on-the-fly integration of data and data products enabling decision-makers to make better, more informed decisions, and generate cost-effective solutions.

Multi-sensor data fusion

Floodplain mapping

National Oceanic and Atmospheric Administration

National Geodetic Survey

Building Outside Capacity

- **Obtaining a Better Understanding of Societal Outcomes**
- **Retraining Workforce From Being “Doers” to Trainers**
- **Working with Customers to Develop New Technologies**
- **Multi-Discipline Groups Working Together to Achieve Outcomes**
- **Informing Scientific Organizations of Customers Requirements**
- **Increasing Role in Shaping National/International Geospatial Policy**

- **Changing From Central Control to Local Involvement**

National Oceanic and Atmospheric Administration

National Geodetic Survey

Resulting In:

Reduction of redundant work within and among agencies, providing operational efficiencies, and working with private industry and government to develop National Geospatial Policy.

Obtaining high-accuracy geo-referenced data using an array of novel GPS technologies

Training volunteers on using elevations to guide wetland restoration activities

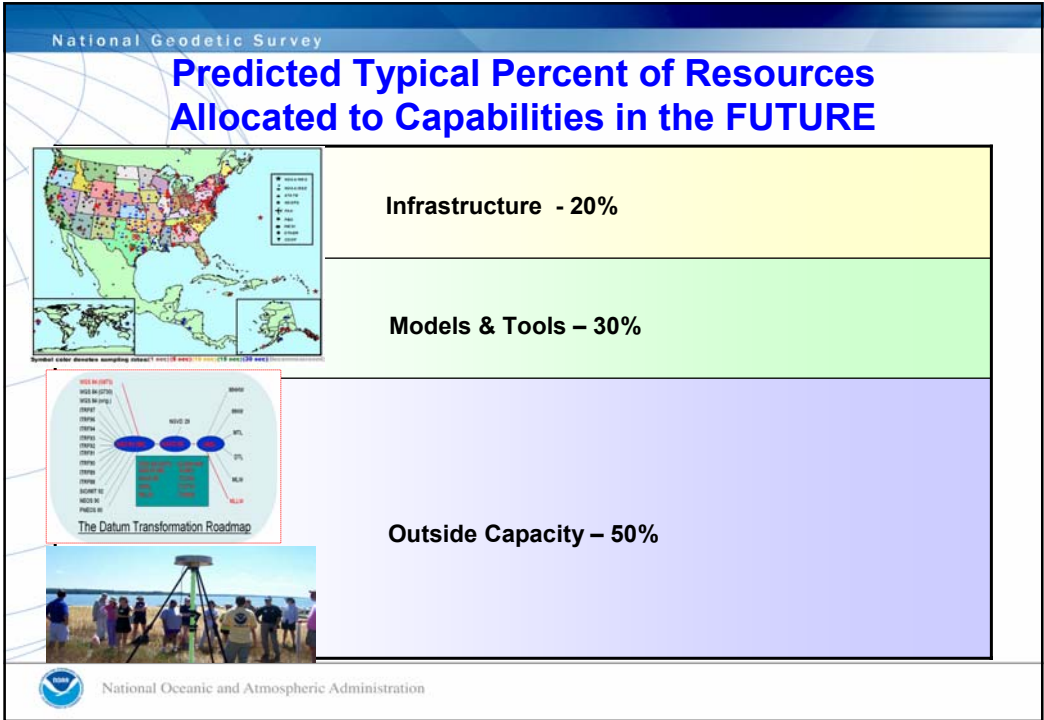

Increased efficiency and better environmental stewardship through precision agriculture

Restoration of critical commerce infrastructure

National Oceanic and Atmospheric Administration

National Geodetic Survey

Infrastructure - 20%

Models & Tools - 30%

Outside Capacity - 50%

What does this mean to the surveyor and the geospatial user community?

How do we get there?

National Oceanic and Atmospheric Administration

Support for New Customers

- With the help of GNSS, more accurate DEMs can be produced to support Community Resiliency efforts by better detecting local relative sea-level rise and water-levels in flood prone areas.
- DEMs in coastal ecosystems provide a better understanding of a wetland's ability to serve as a storm-surge buffer.

Multi-Sensor Data Fusion Approach of Geodetic and Remote Sensing Technologies

- Coastal zone managers are able to make more informed decisions about fisheries programs, stock assessments, algal blooms, and other issues affecting the health and vitality of coastal ecosystems.

Meeting Future Needs Requires a CULTURAL CHANGE

CULTURAL CHANGE:

- Outcome driven
- Customer focused
- An integrated and collaborative organization
- A retrained & retooled workforce

Infrastructure - 20%

Models & Tools - 30%

Outside Capacity - 50%

Some of the Outcomes We Need to Focus On

- Coastal Inundation
- Drought
- Earthquake
- Flood
- Human & Ecosystem Health
- Hurricanes
- Landslide and Debris Flow
- Tornado
- Tsunami
- Volcano
- Heat Waves
- Technological Disasters
- Wildland Fires
- Winter Storms

Some Customers We Need to Listen to and Work With

- Emergency Managers
- Planners and Developers
- Insurance Industry
- Agricultural Industry
- Construction Industry
- Environmental Engineers
- Coastal Managers
- Local governments
- Tribal governments
- International Organizations
- Academia
- Professional Organizations
- Private Sector
- Foreign Counterparts

How Can We Make This Happen?

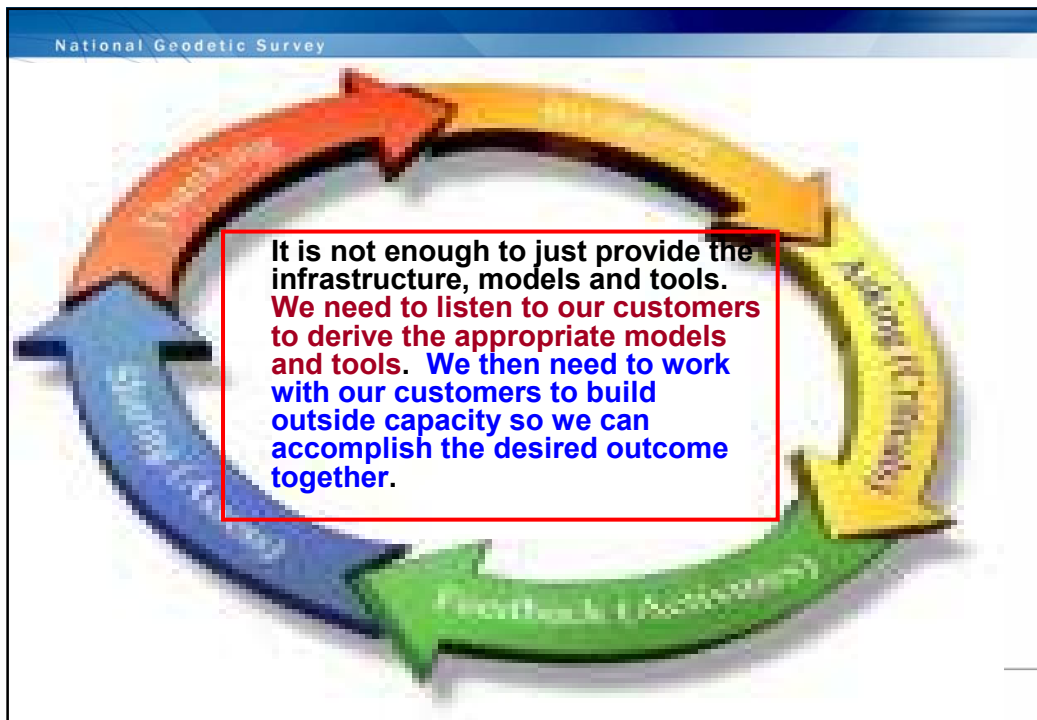

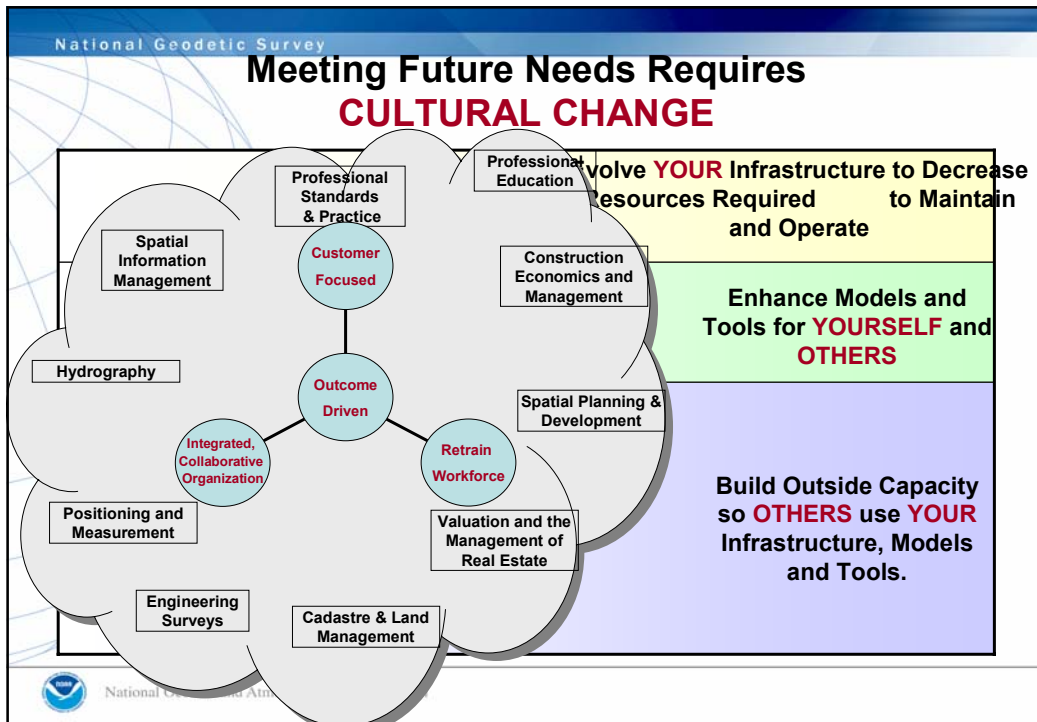

- Help shape geospatial policy by being more involved in positions that create national and international policy
- Work with other disciplines to achieve agreed upon outcomes
- Retrain workforce from being the “doers” to being the teachers and trainers
- Set goals and actions that require collaboration with other organizations to achieve a common outcome
- Develop cross-discipline work plans that will achieve agreed upon outcomes
