# CONTENTS

1

## Background

- Challenges & Opportunities in Modern Engineering Surveying
- Dynamic and Precise Surveying
- Early Research & Work

2

## Methods

- Continuous and robust positioning and navigation in mobile and constrained scene
- Rapid sensing of multi-scale and multi-mode spatial information
- Multi-scale modelling and multi-index interpretation of surveyed object

3

## Dams

Inertial Surveying of Internal Dam Deformation

4

## Bridges

Vision and IMU Surveying of Long-Span Bridges

5

## Pipelines

Multi-sensor Robot for Pipeline Surveying

# CONTENTS

Multi-sensor Robot for Pipeline Surveying

# Background—Challenges & Opportunities

Infrastructure is the essential support to social and economic activities.

**2010.05.23**  
Railway derailed  
Shanghai-to-Yunnan, China  
19 people died

**2021.06.24**  
Building collapse  
Miami, USA  
98 people died

**2011.07.14**  
Bridge collapse  
Wuyi Mountain in  
Fujian, China  
1 people died

**2020.05.19**  
Dam burst  
Michigan, USA

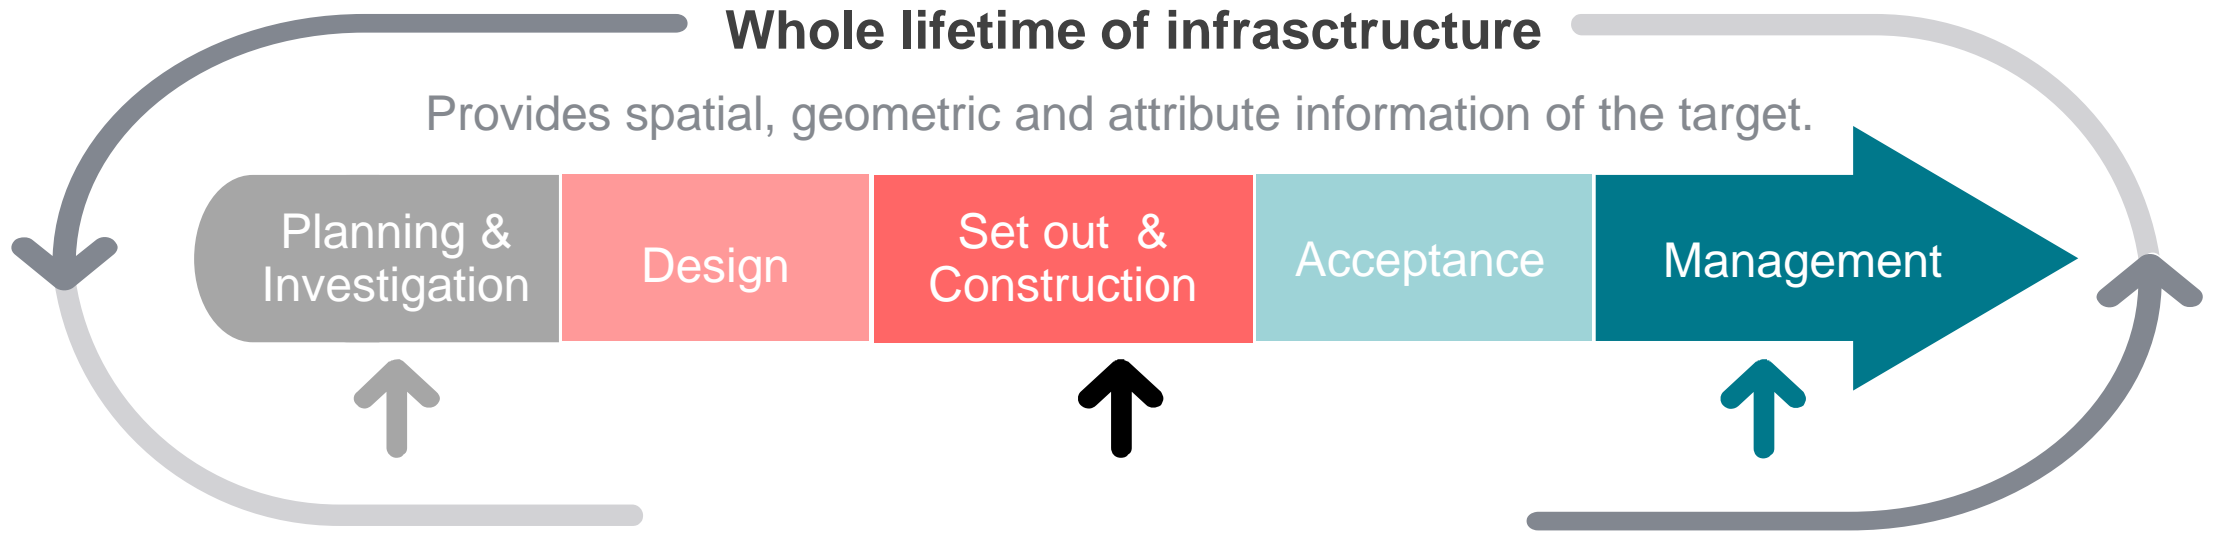

**2011.08.22**  
Subway tunnel damage  
Nanjing, China

**2020.01.13**  
Road surface collapse  
Xining, Qinghai, China  
4 people died

# Background—Challenges & Opportunities

exploration survey

setting out

monitoring

# Dynamic and Precise Surveying

## Typical interdisciplinary

Multi-sensors set up on mobile platform to acquire various surveying data, and to extract multi-dimension, multi-type and multi-scale features/indexes of the object by using intelligent data analysis.

# Dynamic and Precise Surveying

**fundamental methods**

1. Continuous and reliable positioning and navigation in mobile and constrained scene
2. Rapid sensing of multi-scale and multi-mode spatial information
3. Multi-scale modelling and multi-index interpretation of the surveyed object

**rapid deflection surveying**

**comprehensive appearance surveying**

**precise lining surveying**

**novel techniques**

**industrial applications**

**road, railway, bridge, tunnel, pipeline, dam, etc.**

# Early Research & Work—road surface deflection

road surface

deformation -> deflection

**road deflection :**

Deformation after full deformation of standard load or rebound after removal of load ( unit : **0.01mm**)

Benkelman Beam

Falling Weight Deflectometer (FWD)

- efficiency: 1-3 km/h
- sampling rate: 10-50 m
- safety: high risk, traffic disturbance
- limitation: no dynamic state of the platform

**challenges**

- **Full deformation** is hard to complete in **moving status**.
- Sensors and the target are both moving, leading to **large noises** which **hinders high-precision measurements**.
- Noises caused by **environmental factors, such as temperature and material variations** need to be rectified.

# Early Research & Work—road surface deflection

- Inverse road surface deflection from **deformation velocity** measured at **multiple points** around the deflection basin.
- Measuring equipment is multiple Doppler velocimetry sensors installed on a rigid beam.

surveying mode

beam coordinate

road surface coordinate

speed model

deform model

corrected model

$$\theta = \arcsin\left(\frac{V_{dr} - V_v - V_{wr}}{V_h}\right) - \alpha_r$$

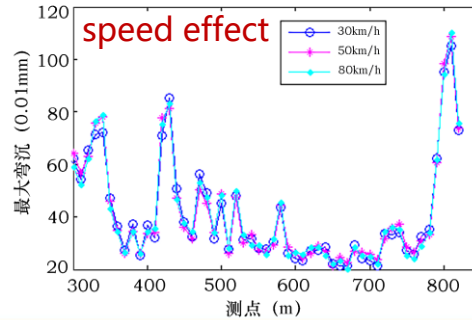

$$V_{ri} = V_{di} - V_{dr} \cos(a_i - a_r) - \frac{G_x \pi}{180} (l_i - l_r) - V_h \sin(a_i - a_r) + \varepsilon_2$$

$$\varepsilon_2 = V_{wr} (\cos(a_i - a_r) - 1) + V_h \sin(a_i - a_r) [1 - \cos(\arcsin \frac{V_{dr} - V_{wr}}{V_h})]$$

$$A' \sin(B'x_i) e^{-B'x_i} - \frac{V_{ri}}{V_h} + \Delta A \sin(B'x_i) e^{-B'x_i} + \Delta B A' x_i e^{-B'x_i} [\cos(B'x_i) - \sin(B'x_i)] = 0$$

$$A' \sin(B'x_j) e^{-B'x_j} - \frac{V_{rj}}{V_h} + \Delta A \sin(B'x_j) e^{-B'x_j} + \Delta B A' x_j e^{-B'x_j} [\cos(B'x_j) - \sin(B'x_j)] = 0$$

$$F = b_0 + \sum_{k=1}^3 b_k X_k + \sum_{k=1}^3 \sum_{p=k}^3 b_{kp} X_k X_p + \varepsilon$$

# Early Research & Work——road surface deflection

- ❑ **The first dynamic deflection measuring equipment in P.R. China**, surveying speed improved from 1-3 km/h to 90 km/h.
- ❑ **Achieved rapid and high-precision deflection measurement** of the road network.

	achievement	TSD ( Denmark )
speed	15-90km/h	20-80km/h
resolution	0.01 mm	0.01 mm
adaptability	rigid/semi rigid/flexible	flexible subgrade
price	2.37 million dollars	3.55 million dollars

Efficient Calibration of a Laser Dynamic Deflectometer, IEEET INSTRUM MEAS, 2013.

# Early Research & Work—surface distress

Surface distress reflects structural or material deterioration.

Requirements : road 7 categories--26 classes || tunnel 10 categories--40 classes || railway 3 categories--30 classes.

**objectives**

- 3D point cloud & images
- professional equipment

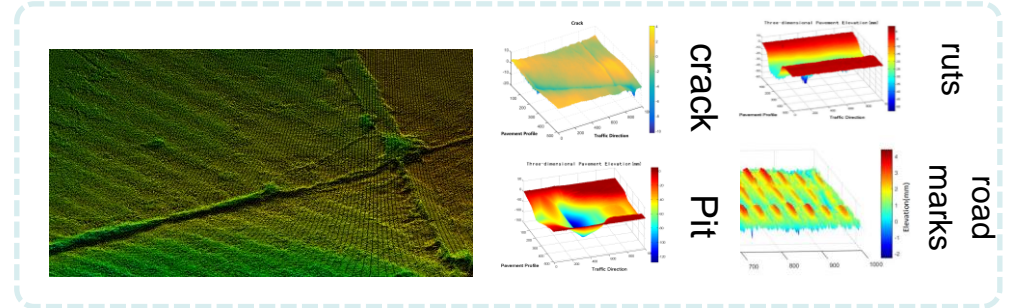

# Early Research & Work—surface distress

High-frequency structured light 3D scanner to measure **multi-type surface distresses**.

3D scanning

structured light scanner

$$I_d' = I_{in} \cos \alpha \cdot k_d \cdot \cos(\theta_d - \alpha)$$

$$I_d = \frac{I_d' \cdot (1 + \tan^2 \alpha) \tan \theta}{\tan \theta + \tan \alpha}$$

$$\frac{I_d'}{I_d} = \frac{\tan \theta + \tan \alpha}{(1 + \tan^2 \alpha) \tan \theta}$$

light intensity

$$\sigma_l^2 = \frac{1}{N_l - 1} \sum_{k=1, x_k < \mu}^{N_l} (x_k - \mu)^2$$

$$\sigma_r^2 = \frac{1}{N_r - 1} \sum_{k=1, x_k > \mu}^{N_r} (x_k - \mu)^2$$

light calibration

Automatic pavement defect detection using 3D laser profiling technology, AUTOMAT CONSTR, 2018.

# Early Research & Work—surface distress

Surveying cars for road surface and tunnel wall inspection.

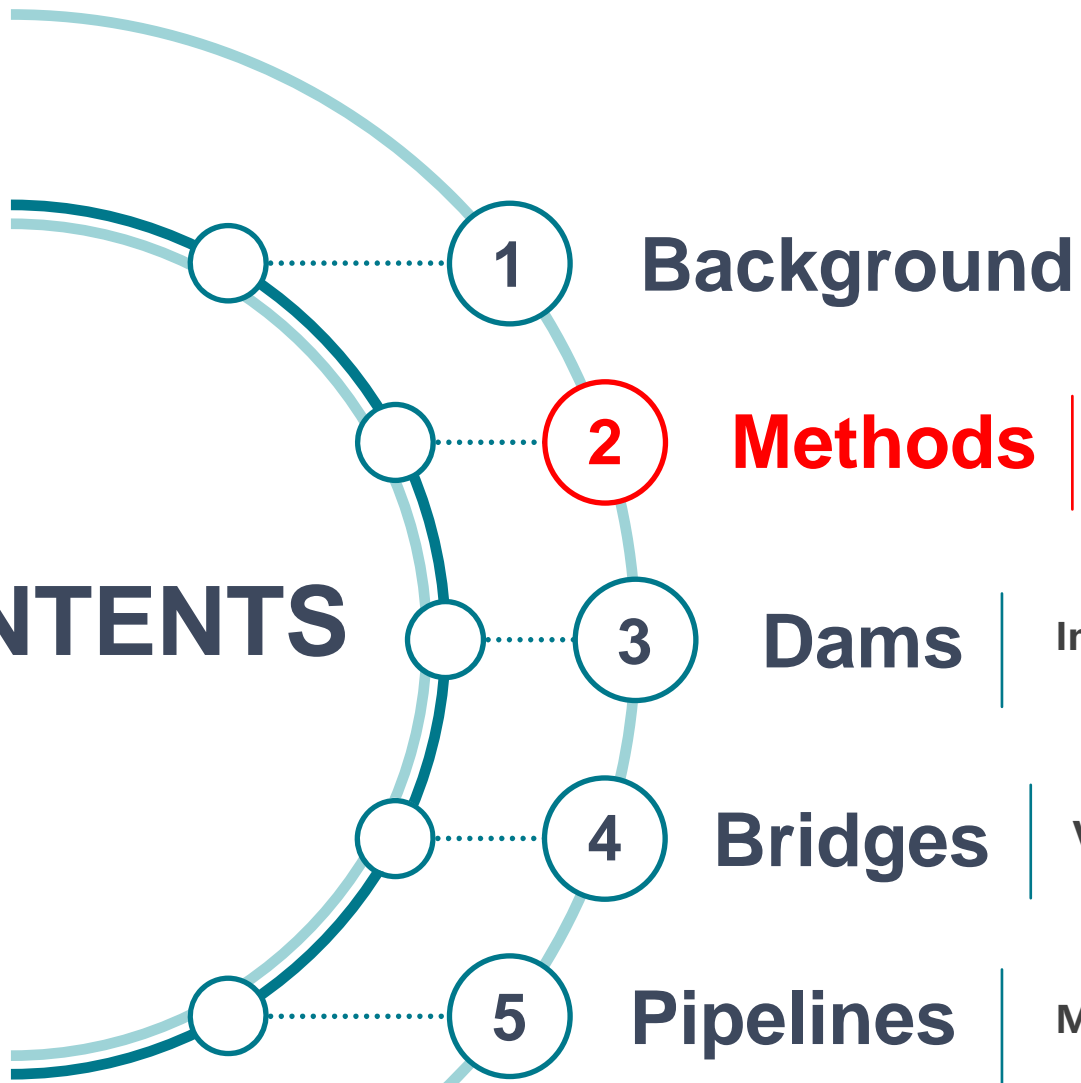

**Multi-sensor rail track inspection equipment**, which has been applied to urban subway in tens of Chinese cities, and also railways in China and Pakistan.

- Authorized Us/Canada/Australia invention patents: US10571256/CA3021730/AU2016399114.
- Authroized China invented patents: 201430464555.2/ZL200910177893.6

# CONTENTS

- Challenges and Opportunities in Modern Engineering Surveying
- Dynamic and Precise Surveying
- Early Research & Work

- Continuous and robust positioning and navigation in mobile and constrained scene
- Rapid sensing of multi-scale and multi-mode spatial information
- Multi-scale modelling and multi-index interpretation of surveyed object

Inertial Surveying of Internal Dam Deformation

Vision and IMU Surveying of Long-Span Bridges

Multi-sensor Robot for Pipeline Surveying

# M1 Continuous and robust positioning in mobile and constrained scene

- Proposed **robust positioning** and **scene enhancement** with EOANS (electro-optical aided navigation system), realised **positioning of mm-level** for mobile platform and changing scenes.
- Provide high-precision and continuous space and time references for mobile platforms.**

open area

no satellite signal

$$P(S_k | Z_k) \propto P(Z_k | S_k) = \exp\left(\sum_{i=1}^n \lambda_i \cdot P(Z_k^i | S_k)\right)$$

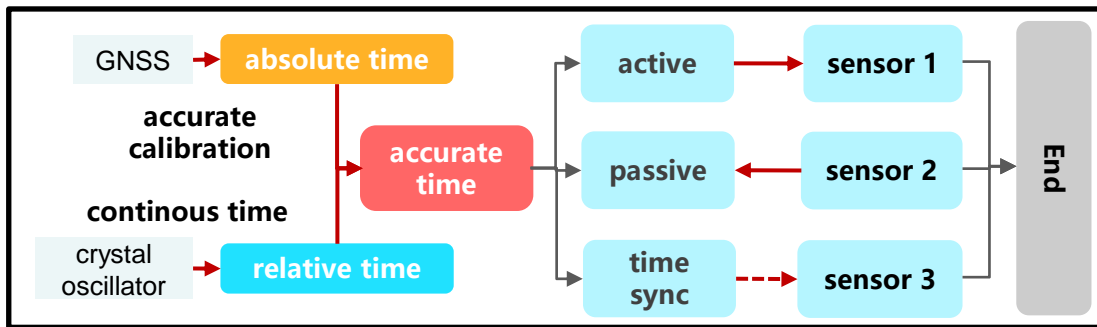

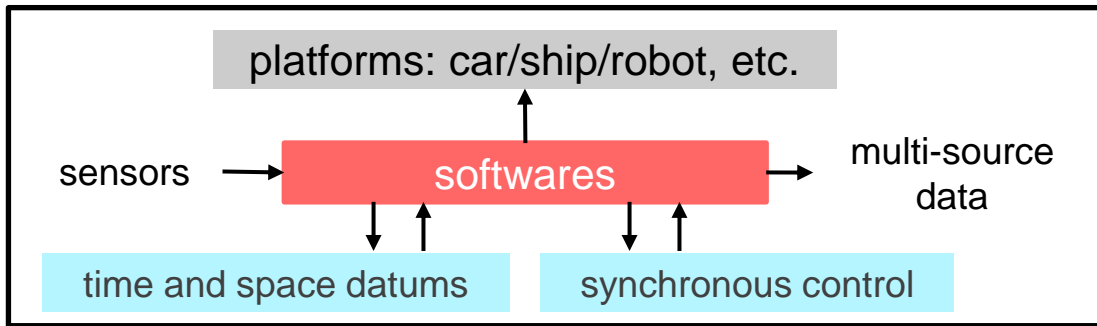

$$P(S_{k-1} | S_k) = \frac{1}{\sqrt{2\pi}\sigma_d} e^{-\frac{1}{2\sigma_d^2}d(S_{t-1},S_t)^2} \cdot \frac{1}{\sqrt{2\pi}\sigma_\theta} e^{-\frac{1}{2\sigma_\theta^2}\theta(S_{t-1},S_t)^2}$$

attitude measurement method based on factor graph model

# M2 Rapid sensing of multi-scale and multi-mode spatial information

- ❑ Invented a multi-sensor integrated synchronous control device, designed a multi-platform unified architecture, and realized efficient and high-precision sensing of multi-platform and multi-scale data.
- ❑ **Provide a unified architecture for different platforms.**

cross platform unified architecture

active/passive/time synchronous control

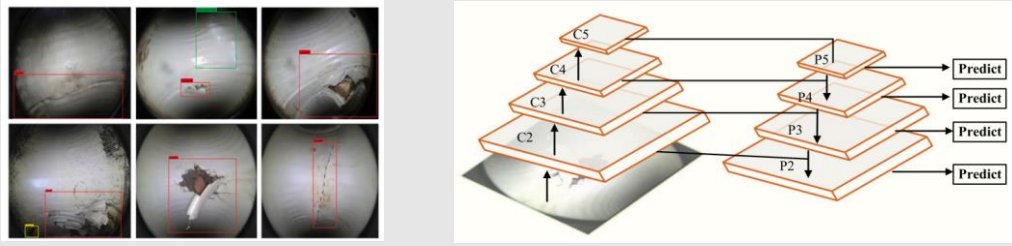

# M3 Multi-scale modelling and multi-index interpretation of surveyed object

Combine **priori knowledge** and **multi-scale modelling** to restore **multiple features** of **multi-scale** infrastructure.

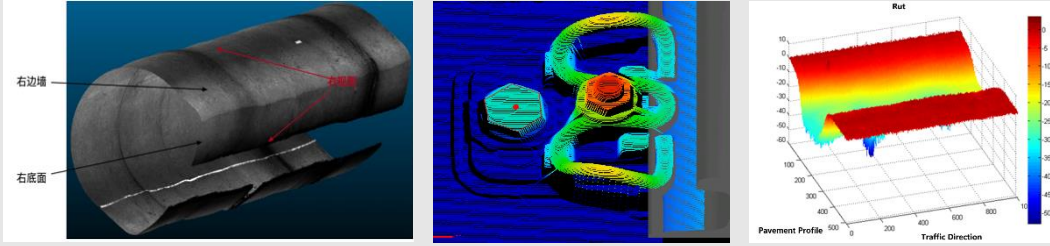

**data driven**

long-tail effect of the training data

**model driven**

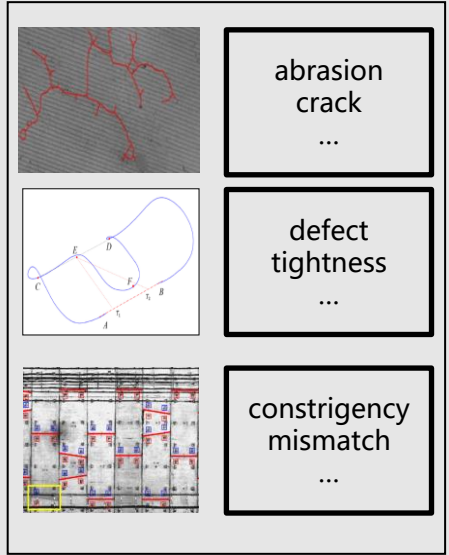

multi-scale construction objects

**priori knowledge**

**multi-scale modelling**

**multi-index intelligent analysis**

- abrasion crack ...
- defect tightness ...
- constringency mismatch ...

**Inertial Surveying of Internal Dam Deformation**

Vision and IMU Surveying of Long-Span Bridges

Multi-sensor Robot for Pipeline Surveying

# Inertial Surveying of Internal Dam Deformation

- ❑ No control point inside the embedded pipe and requires long distance, continuous surveying.
- ❑ **Multi-condition constrained inertial surveying** achieves **relative accuracy of 1/100,000**.

line measuring

factor graph fusion

new methods

Internal deformation monitoring for earth-rockfill dam via high-precision flexible pipeline measurements, Automation in Construction, 2022.

# Inertial Surveying of Internal Dam Deformation

- high-precision measuring robot which inverting the deformation of internal dam by measuring the deformation of the embedded flexible pipe (mm-level precision).
- Lianghekou, Jiayan, Tianchi dams in China, and also used to measure **ice surface flatness** of the Beijing Winter Olympics speed skating stadium.

the measuring robot

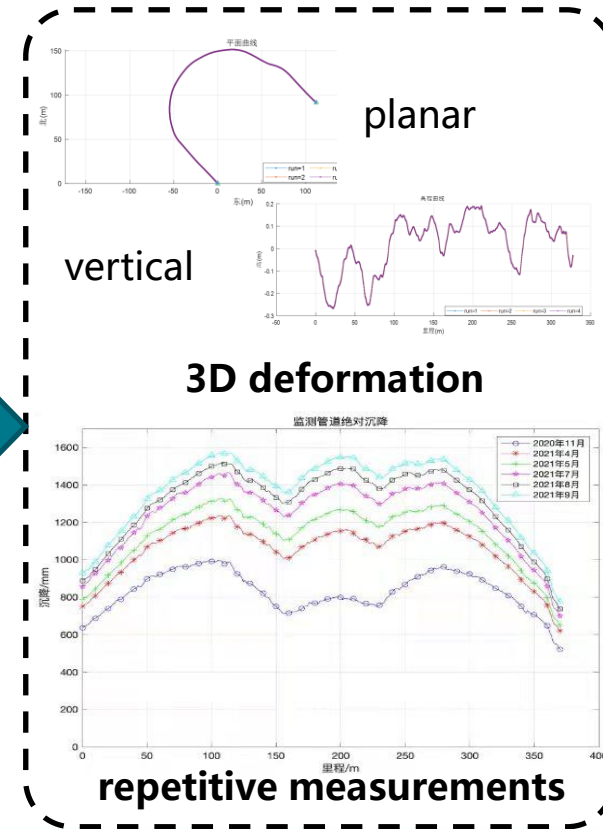

embedded pipe

in-situ set-up

periodic measurement

# Inertial Surveying of Internal Dam Deformation

- Lianghekou hydropower station has the highest (265 m) rockfill dam in China, with long construction period and large deformation.
- The pipeline measuring robot is used to measure the dam deformation, providing a new method for monitoring the internal deformation of large-scale rockfill dams.

Lianghekou hydropower station

embedded pipe

no control point  
in closed space

## CP III control network for high speed railway survey

continuous monitoring of long-span bridges

control point  
moves  
on the bridge

**How to achieve high-precision line measurement with no stable control point?**

# Vision and IMU Surveying of Long-Span Bridges

- ❑ Invented **inertial vision sensor** with recursive positioning to achieve dynamic and continuous surveying for a long line structure.
- ❑ **Solved the problem that the control point itself is unstable**, and its surveying frequency reaches 30 Hz, and precision reaches mm-level.

$$x - x_0 = -f \frac{a_1(X - X_S) + b_1(Y - Y_S) + c_1(Z - Z_S)}{a_3(X - X_S) + b_3(Y - Y_S) + c_3(Z - Z_S)}$$

$$y - y_0 = -f \frac{a_2(X - X_S) + b_2(Y - Y_S) + c_2(Z - Z_S)}{a_3(X - X_S) + b_3(Y - Y_S) + c_3(Z - Z_S)}$$

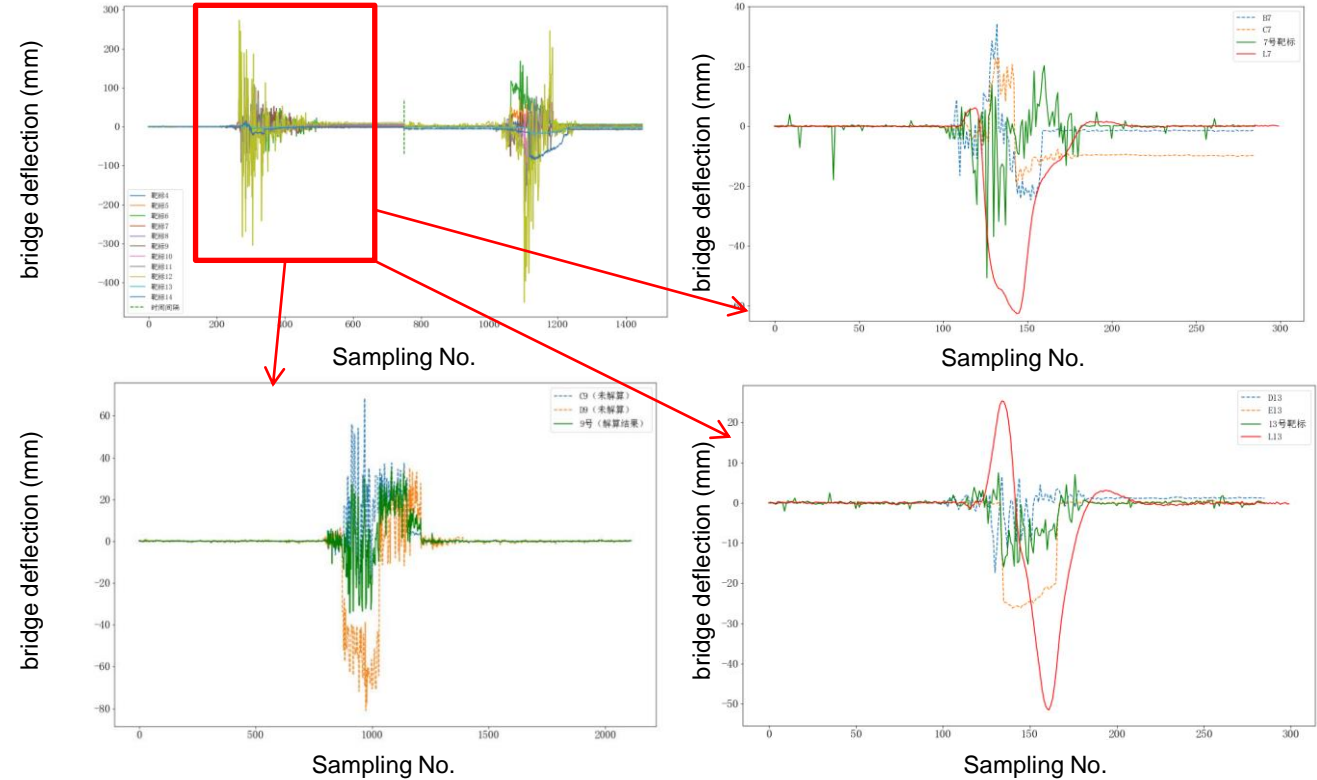

Monitoring the Dynamic Deflection of Bridges using Computer Vision. JOURNAL OF GEOMATICS, 2020.

# Vision and IMU Surveying of Long-span Bridges

- ❑ Xijiang bridge, Foshan is a long bridge over the Pearl river, with the longest span of 600 meters .
- ❑ The vision and IMU surveying system was used to monitoring the real-time linear deformation of the bridge. It well captured the high-frequency displacement of multiple points when the train passed through the brigde.

# CONTENTS

1

## Background

- Challenges and Opportunities in Modern Engineering Surveying
- Dynamic and Precise Surveying
- Early Research & Work

2

## Methods

- Continuous and robust positioning and navigation in mobile and constrained scene
- Rapid sensing of multi-scale and multi-mode spatial information

3

## Dams

Inertial Surveying of Internal Dam Deformation

4

## Bridges

Vision and IMU Surveying of Long-Span Bridges

5

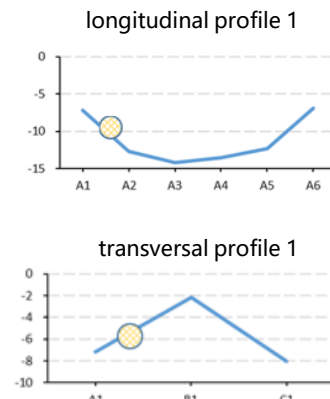

## Pipelines

Multi-sensor Robot for Pipeline Surveying

# Multi-sensor Robot for Pipeline Surveying

- Deployment of the underwater tunnel is dependent on the surveying tower. The tower itself has a deformation above 3 mm.
- Proposed to survey the deformation of **central line** by using **recursive vision surveying**.

# Multi-sensor Robot for Pipeline Surveying

- ❑ Invented a **capsular detector** with **camera and IMU**, which can be **drifting on the waterflow** to capture the images inside the drainage pipeline. It has been applied in more than ten cities in China.
- ❑ Deal with the surveying problem when there is **water inside the pipeline**.

IMU+Visual->Pipeline damage locatoin

pipe damage detection based on CNN

Detection and classification of pipe defects based on pipe-extended feature pyramid network, AUTOMAT CONSTR, 2022.

# Multi-sensor Robot for Pipeline Surveying

- Dongjiang water supply project is an important infrastructure for Hong-Kong's water supply.
- We invented a Lidar and vision robotic car for surveying the water pipeline, achieving fine-scale inspection of the pipeline wall distress.

# Conclusions

- Engineering surveying supports the **whole lifetime** of engineering projects. Nowadays, it is transferring from **surveying** to **detection and monitoring**, from **geometric parameters** to **multi-index extraction**, from **single-scale** to **multi-scale**.
- Dynamic and precise engineering surveying is one important **interdisciplinary field** and mainly deals with **high-precision multi-index surveying** in **dynamic mode** (moving platforms and changing scenes).
- Surveying requirements in engineering construction are **diverse** and **complex**. The demanding requirement calls for **novel ideas, methods** and **equipments** to deal with the real-scene problems, and to achieve **dynamic, continuous and high-precision surveying**.
