Key words: curriculum, common foundation, distinguished feature and superiority compulsory course, elective course, Bachelor program.

ABSTRACT

It is very important to well design the curriculum for the 4-years bachelor program of surveying & mapping in the universities, in order to produce more talents with wide knowledge, solid foundation, strong ability and nice personality. We should pay more attention not only to the common foundation, but also to the distinguished features and superiorities, especially for the universities (colleges) with different backgrounds on surveying & mapping. Under the direction of the Educational Guiding Committee of Surveying & Mapping of China, there are some different models with the same core courses and distinguished features and superiorities, especially under 9 sub-directions. More detail about these in this paper.
