11-15 September 2022 in Warsaw, Poland*

# Data Quality and Outdoor Positioning Accuracy of Recent Smartphones with Dual Frequency GNSS Receivers

Andreas Slateff, Guenther Retscher (TU Wien, Austria, Europe)

Paper No. 11575, Session TS04G

FIG Congress Warszawa, Sep 13, 2022

## Original Intention: Student Projects Spring 2021

- Kinematic Positioning Experiments  
Continuous, Stop & Go
- Precise Point Positioning (PPP), DGNSS
- Google Pixel 5 Android Smartphone with  
Dual Frequency Receiver L1/L5 Band
- Spectra SP 80 RTK GNSS Receiver as Reference
- Experiments: LBS Course  
Andreas Slateff, Henri Schauer, Katharina Fehn
- BSc-Thesis  
Till Weigert

**Google Pixel 5**

# SP80 Reference Trajectory

# Stop & Go Pixel 5 and Spectra SP80

(7 Stop Points)

Large Scattering of  
Positioning Solutions!

## Back to the Start:

- Static Measurements
- Try to Identify Influencing Factors
- Google Pixel 5 and Samsung S21 5G
- Permute Positions & Orientation
- Permute Configurations
- Test Several Apps

© 2022 Slateff

© 2022 Slateff

## Results of Static Measurements:

- Android Apps Unstable and Crash
- Smartphone Display Timeout Sometimes Kills Apps
- Sometimes Carrier Phase Data Recorded, Sometimes Not
- L5/E5 Band Data Scarcely Recorded
- General Low Data Quality (Low S/N-Ratio)
- Positioning Accuracy in Decimeter Range Only (15-30 minutes static)  
if Carrier Phase Data Available
- Positioning Accuracy in Meters or Worse Only  
if Carrier Phase Data Not Available or of Too Low Quality  
or of Too Little Frequency

# GNSS Literature: “Publication Bias?”

- In literature, results on technological progress published –  
at the frontline of available technology
- Studies concentrate on particular devices (e.g. Xiaomi Mi 8, Huawei P30)
- Centimeter to decimeter accuracy claimed, e.g.  
Wanninger et al. 2020  
Psychas et al. 2019  
Wu et al. 2019
- Almost no papers address reliability of Android GNSS apps  
or Smartphone configuration

# Results of Smartphone GNSS- Experiments:

## Reproducible? Transferable?

- Further investigation necessary!
- Extensive calibration required? (Antenna phase centre variations...)

# Some Topics to Consider for GNSS Smartphone-Experiments and Publications:

- Airplane Mode active: Yes/No?
- Developer Mode active: Yes/No?
- Display Timeout (how long?) or Always On Display?
- Other Receivers (e.g. WirelessLAN, Bluetooth,...) active: Yes/No?
- Which Apps Used for Collecting the Data?
- Other Apps Running in the Background?
- Power Supply Active (which one? USB? Magnetic?) or Battery?
- Orientation of the Device in Space?
- ... (to be extended)

# Thank You for Your Attention!

## Any Questions?
