

ArcGIS Solutions for Cadastre

Stop by the Esri booth to see how we're helping agencies and countries leverage geographic information system (GIS) technology to modernize their land administration systems.

Learn more about

Legitimizing land for the future.

There is no need to build a system of record from scratch that everyone can rely on. ArcGIS provides the tools to document who owns/occupies what. GIS delivers the "where" and provides easily accessible and useful authoritative data.

Simplifying field mapping of land rights.

Have field staff map parcel boundaries with a mobile device or a Global Navigation Satellite System (GNSS) receiver, even offline. When connected, upload the data to the secure Esri Geospatial Cloud with just a few clicks, which saves you time, minimizes errors, and increases accuracy.

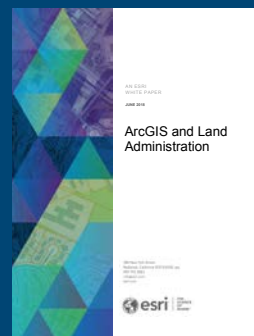

Monitoring work status in real time.

Workforce for ArcGIS provides real-time feedback to managers. As fieldworkers collect property data, you can track and monitor their progress and see which parcels still need to be reviewed.

Sharing data on maps and apps.

Esri provides many ready-to-use apps for viewing land data along with open data capabilities that allow the public to view or connect to your authoritative data or access it via APIs.
